

Architectural Brand Experience

Master Product & Technical Specification

0. Project Overview

Project type: Architectural brand portfolio + online presence

Primary objective: Establish a premium digital presence and generate qualified enquiries

Secondary objective: Showcase architectural thinking, completed projects, interiors, and geographical presence

Experience goal: Make the website feel like entering and exploring a well-designed architectural space.

Core proposition

From the first sketch to the final structure, every detail is considered.

The website should communicate:

- Reliability
- Class
- Craftsmanship
- Personal attention
- Architectural excellence
- Interior excellence
- Professionalism
- Capability across different project scales

Target audiences

Residential

- Individual homeowners
- Families planning new homes
- Property owners renovating/building

Commercial

- Business owners
- Developers
- Commercial property investors

Large-scale

- Developers
- Contractors
- Organizations requiring structural/architectural planning

Secondary

- Architects
 - Interior designers
 - Contractors
 - Industry professionals
 - Potential collaborators
-

1. Business Problem

Current situation

The firm's primary acquisition channel is **word of mouth**.

This creates a problem:

Someone hears about the firm.

They receive the website/contact information.

They visit the website.

The website becomes the first impression.

The visitor should immediately feel:

"These people know what they're doing."

The website therefore isn't simply a portfolio.

It becomes the firm's **digital showroom + credibility engine + lead-generation platform**.

2. Business Goals

Primary

Increase online discoverability.

SEO should allow people searching for relevant architectural services to discover the firm organically.

Secondary

Build trust before the first conversation.

The visitor should already understand:

- What the firm does
- What type of projects it handles
- Where it operates
- The quality of its work
- Its design philosophy
- Its process

Third

Convert visitors into enquiries.

Every major journey should eventually provide a natural path toward:

Contact → consultation → project discussion

3. Brand Personality

The visual language should communicate:

Reliability

Clean layouts, structured information, professional photography.

Class

Typography, spacing, restrained animation and strong composition.

Premium

Not excessive decoration.

Premium should come from **attention to detail**.

Human

Sketches, planning documents, team photography and signatures.

Intelligent

The website should demonstrate that architectural decisions are deliberate.

4. Design Philosophy

The central idea

The website should feel like entering a well-designed building.

Every element should have a purpose.

Every transition should communicate something.

Every interaction should reinforce the brand.

Avoid:

- Excessive animations
 - Generic glassmorphism
 - Random 3D objects
 - Gratuitous WebGL
 - Huge walls of text
 - Generic architecture templates
 - "Award website" effects that compromise usability
-

5. User Journey

SEARCH / REFERRAL

6. Loading Experience

The loading screen serves two purposes:

Functional

Preload critical assets.

Psychological

Make the visitor feel that the experience has already begun.

Example:

[LOGO]

ARCHITECTURE
/ SPACE
/ FORM
/ DETAIL

78%

ENTERING EXPERIENCE

Loading strategy

Prioritize:

1. Critical fonts
2. Hero image/video
3. First viewport assets
4. Essential JavaScript
5. Above-the-fold 3D assets

Do **not** preload the entire website.

Lazy-load:

- project galleries
- below-the-fold images
- heavy 3D assets
- videos
- secondary sections

Important

The loader should disappear as soon as the **critical experience is ready**.

It should not intentionally create a long wait.

7. Landing Page

Hero

The hero should be visually powerful but restrained.

Potential structure:

Motion

- Subtle image parallax
- Typography reveal
- Slow image movement
- Mask transitions
- Scroll-driven composition

Avoid excessive motion immediately.

The first impression should feel **calm and expensive**.

8. Brand Introduction

After the hero, introduce the philosophy.

Rather than a traditional:

"About Us"

use a strong statement.

Example concept:

We design spaces with purpose, character and permanence.

Then reveal supporting text progressively.

9. Sketch / Planning System

This is one of the project's **signature features**.

Use actual:

- sketches
- rough layouts
- floor plans
- annotations
- planning diagrams
- architectural drawings

These shouldn't merely decorate the page.

They should communicate the **thought process**.

Example interaction

The visitor sees how an idea becomes reality.

Emotional message

Your project isn't treated like a template. It is designed and considered.

10. Projects Section

Projects are the primary proof of capability.

Each project should have:

- Hero image
- Project name
- Location
- Year
- Category
- Short description
- Blueprint
- Process
- Final photography
- Related projects

Project categories

Potential filters:

ALL
RESIDENTIAL
COMMERCIAL
INTERIOR
LARGE SCALE

Don't over-engineer filtering initially.

11. Project Detail Experience

Each project gets its own URL.

Example:

/projects/residence-01
/projects/commercial-complex
/projects/villa-03

This is important for **SEO as well as UX**.

Section A — Hero

Full-screen architectural photography.

RESIDENCE 01

BHOPAL, INDIA
2026

Subtle parallax.

Section B — Project Introduction

Short description.

Focus on:

- Design challenge
- Intent
- Context
- Architectural response

Avoid unnecessary marketing copy.

Section C — Project Details

TYPE

Residential

LOCATION

Bhopal

YEAR

2026

SCOPE

Architecture + Interior

AREA

XXXX SQ FT

12. Blueprint Experience

Instead of displaying a static blueprint image:

Create an interactive viewer.

Possible controls:

GROUND FLOOR

FIRST FLOOR

SECTION

ELEVATION

The user can switch between drawings.

Potential future feature:

Blueprint → 3D interpretation

13. From Blueprint to Reality

This should be one of the strongest sections.

Story structure

CONCEPT

SKETCH

BLUEPRINT

CONSTRUCTION

INTERIOR

FINAL BUILD

Use scroll-triggered transitions.

For example:

Blueprint occupies screen

scroll

walls rise

scroll

materials appear

scroll

final photograph replaces the construction

This is where Three.js/WebGL can genuinely add value.

14. Final Project Gallery

Photography should dominate this section.

Use:

- Large imagery

- Variable aspect ratios
- Controlled whitespace
- Subtle transitions

Don't create a generic masonry gallery unless it actually fits the photography.

15. Project Navigation

At the end:

PREVIOUS PROJECT

NEXT PROJECT →

COMMERCIAL 04

The transition into the next project should feel continuous.

Potentially:

Current image → zoom → transition → next project hero

16. City / Project Map

This is your second major interactive feature.

Use a satellite/city map.

CITY

- Residence 01
- Residence 02
 - Commercial 01
- Villa 04

Hover:

RESIDENCE 01
Residential

2026

Click:

Open Project

Important UX principle

The map isn't decoration.

It answers:

"Where have they actually worked?"

That reinforces credibility.

17. Philosophy Section

Keep it concise.

Possible structure:

OUR APPROACH

Context.

Function.

Material.

Light.

People.

Then a short statement.

The goal is to communicate **how they think**, not just what they make.

18. Team Section

Humanize the company.

Include:

- Team photograph
- Founder/lead
- Key members

- Roles
- Short descriptions

Then potentially:

Signature

A handwritten signature or actual signature-style graphic.

This reinforces the idea of **personal responsibility and craftsmanship**.

19. Contact

The contact section should feel like the natural conclusion.

Not:

"CONTACT US!!!"

Instead:

HAVE A PROJECT IN MIND?

Let's discuss what you're building.

[START A CONVERSATION]

Potential contact methods:

- Phone
- Email
- WhatsApp
- Contact form
- Office location

Keep the primary CTA obvious.

20. Footer

Minimal.

BRAND

Architecture
Interiors
Design

Projects
About
Contact

Instagram
Email
Phone

© 2026

And your **logo typography** can become the final visual element.

21. Technical Architecture

Frontend

React

Responsibilities:

- UI
 - Routing
 - Components
 - Project data
 - Interactive sections
-

3D

Three.js

Responsibilities:

- Architectural 3D scenes
- Camera movement
- Blueprint visualization
- Spatial transitions
- Interactive environments

If the 3D experience becomes deeply integrated with React, consider:

React Three Fiber

rather than manually managing every Three.js scene.

Animation

GSAP

Use:

- ScrollTrigger
 - Timeline
 - Text reveals
 - Image transitions
 - Camera animation
 - Section transitions
-

Smooth scrolling

Lenis

Use it carefully.

Don't let smooth scrolling become a gimmick.

22. Suggested Frontend Architecture

src/

23. Data Architecture

Make projects **data-driven**.

Example:

Project

```
|— blueprints[]
|— process[]
|— gallery[]
|— coordinates
```

This means the website becomes an **architecture platform**, rather than a collection of hardcoded pages.

24. SEO Architecture

SEO is a **core requirement**, not an afterthought.

Every project needs:

- Unique URL
- Unique title
- Meta description
- H1
- Semantic content
- Image alt text
- Open Graph metadata
- Canonical URL
- Structured data where appropriate

Site structure:

```
/
|— /projects
|   |— /projects/residence-01
|   |— /projects/villa-02
|   |— /projects/commercial-03
|— /about
|— /contact
```

Important rule

Critical information must exist as HTML/text.

Don't put your company's identity, project names and important descriptions exclusively inside Canvas/WebGL.

WebGL = experience.

HTML = information.

25. Performance Architecture

This project has a potentially dangerous combination:

Large images + video + WebGL + GSAP + smooth scrolling.

Therefore performance must be designed from the beginning.

Images

Use:

- WebP
- AVIF where appropriate
- Responsive image sizes
- Proper compression
- Lazy loading

Videos

- Compress aggressively
- Use appropriate resolution
- Poster images
- Don't autoplay huge videos unnecessarily
- Load only when needed

JavaScript

Use:

- Code splitting
- Dynamic imports
- Lazy-loaded 3D scenes
- Remove unused libraries

3D

Optimize:

- Polygon count
- Texture resolution
- Draw calls
- Lighting
- Shadows
- Model size

26. Responsive Strategy

Desktop cannot simply be scaled down.

Desktop

Full cinematic experience.

Tablet

Reduced 3D complexity.

Mobile

Prioritize:

Photography + typography + content.

Heavy WebGL elements can become simplified/fallback experiences.

Potentially:

Desktop → Full 3D

Tablet → Reduced 3D

Mobile → Lightweight 2D / video / image

27. Accessibility

Because this site is animation-heavy:

Required

- Semantic HTML
- Keyboard navigation
- Proper focus states
- Alt text
- Accessible forms
- Good contrast
- Reduced-motion mode

Reduced motion

If the user prefers reduced motion:

Complex animation

Reduced animation

Simple transitions

The content should remain completely understandable.

28. Security Architecture

For a primarily content-driven website:

Security considerations:

- HTTPS
- Security headers
- Content Security Policy where practical
- Secure forms
- Rate limiting on APIs
- Input validation
- No secrets in frontend
- Environment variables
- Dependency auditing
- CDN protection

Jamstack/static delivery reduces the attack surface, but it isn't itself a complete security strategy.

29. Hosting

Your current consideration:

GoDaddy

But don't lock this into the specification yet.

Evaluate hosting based on:

- CDN
- Static deployment
- HTTPS
- caching
- build pipeline
- custom domains
- image delivery
- performance
- deployment workflow

The domain can remain with GoDaddy while the application itself is deployed somewhere more suitable if necessary.

30. Analytics

Eventually track:

- Visitors
- Traffic source
- Most viewed projects
- Project engagement
- Map interactions
- Contact CTA clicks
- Contact form submissions
- Device type
- Performance metrics

This lets the business understand:

Which projects actually generate interest?

31. Content Requirements

Before development, collect:

Brand

- Logo
- Brand name
- Brand colors
- Typography preferences
- Company description
- Philosophy
- Founder statement

Projects

For each project:

- Name
- Location
- Year
- Category
- Area
- Description
- Hero photography
- Gallery
- Blueprints
- Sketches
- Process photographs
- Final photographs
- Coordinates

Team

- Photos
- Names
- Roles
- Bios

Contact

- Phone
- Email
- WhatsApp
- Address
- Social profiles

32. Animation Language

Create a **motion system**, not random animations.

Typography

opacity + y movement + clipping

Images

scale + translate + mask

Sections

fade + position

3D

camera movement + object transformation

Transitions

image → blueprint → image

Keep the animation vocabulary consistent.

33. Visual Language

Typography

Use a combination of:

Strong display type + highly readable body type

Don't use five different fonts.

Color

Start with:

- Architectural neutrals

- Off-white
- Charcoal
- Stone/concrete tones
- One restrained accent

But determine the final palette **after seeing the firm's actual photography and brand identity**.

Texture

Possible subtle elements:

- Paper grain
- Blueprint lines
- Architectural grid
- Concrete texture
- Sketch marks

Use these sparingly.

34. MVP

The first working version should contain:

- ✓ Loader
 - ✓ Hero
 - ✓ Brand introduction
 - ✓ Projects
 - ✓ Project detail
 - ✓ Blueprint viewer
 - ✓ Map
 - ✓ About/team
 - ✓ Contact
 - ✓ Footer
 - ✓ Responsive design
 - ✓ SEO foundation
 - ✓ Image optimization
 - ✓ Deployment
-

35. V2 / Advanced Features

Only after the MVP is working:

- Full 3D architectural scenes
 - Blueprint → 3D transitions
 - Advanced map interaction
 - Project comparison
 - Advanced filtering
 - Interactive floor plans
 - Ambient sound
 - WebGL environments
 - Advanced page transitions
-

36. Development Phases

Phase 01 — Research

Day 1–2

- Competitor research
- Brand research
- Content inventory
- Photography review
- SEO keyword research

Phase 02 — UX

Day 3–4

- Sitemap
- User journey
- Wireframes
- Information architecture

Phase 03 — Visual design

Day 5–7

- Typography
- Colors
- Layout
- Motion language
- Component design

Phase 04 — Technical foundation

Day 8–10

- React setup

- Routing
- GSAP
- Lenis
- Asset pipeline
- SEO foundation

Phase 05 — Core build

Week 2

- Landing
- Projects
- Project detail
- Contact
- About

Phase 06 — Interactive layer

Week 3

- Blueprint interaction
- Map
- Scroll storytelling
- 3D scenes
- Transitions

Phase 07 — Polish

Week 4

- Responsive
- Accessibility
- Performance
- SEO
- Testing
- Deployment

37. Definition of Done

The project isn't finished when:

"It looks cool."

It's finished when:

Brand

- ✓ Feels trustworthy
- ✓ Feels premium
- ✓ Feels human
- ✓ Communicates architectural expertise

UX

- ✓ User understands the company within seconds
- ✓ Projects are easy to discover
- ✓ Navigation is intuitive
- ✓ Contact is obvious

Technical

- ✓ Fast initial load
- ✓ Responsive
- ✓ Accessible
- ✓ No major animation jank
- ✓ WebGL has fallbacks
- ✓ Images optimized

SEO

- ✓ Crawlable pages
- ✓ Project URLs
- ✓ Metadata
- ✓ Sitemap
- ✓ Semantic HTML
- ✓ Optimized images
- ✓ Structured data where appropriate

Business

- ✓ Clear CTA
 - ✓ Contact works
 - ✓ Projects communicate capability
 - ✓ Locations demonstrate presence
-

38. The North Star

Put this **at the very top of your actual project documentation**:

The website should feel like entering a well-designed building.

Calm at first glance.

Detailed when explored.

Human beneath the surface.

Precise in every interaction.

And technically invisible beneath the experience.
